# **Description**

Returns an estimate of the amount of gas that would be required to submit a transaction to the network.

An estimate may not be accurate since there could be another transaction on the network that was not accounted for, but after being mined affects the relevant state.

# **Parameters**

Name Type Description transaction object The transaction to estimate gas for.

#### transaction

object parameters

Parameter Type Description to string DATA, 20 Bytes - The address to the transaction is directed to. from string DATA, 20 Bytes - (optional) The address the transaction is sent from. gasPrice? number / string QUANTITY - (optional) Integer of the gasPrice used for each paid gas. data? string DATA - (optional) Hash of the method signature and encoded parameters. For

details seeEthereum Contract ABI value? number QUANTITY - (optional) Integer of the value sent with this transaction nonce? string A nonce is a value that represents the number of transactions sent by the sender's address, ensuring the transactions are processed in order and preventing replay attacks. gasLimit? string the maximum gas allowed. chainId? number optional the Id of the transaction chain. type? number Optional This is the type of transaction. accessList? array of strings The accessList is an optional transaction parameter that specifies addresses and storage keys a transaction interacts with, enabling gas cost optimization and compatibility with future Ethereum upgrades. maxPriorityFee? number This describes the maximum priority fee for this transaction. maxFeePerGas? number This is the maximum fee per gas for this transaction. ccipReadEnabled? boolean This specifies if the CCIP read is enabled.

# Response

Property Type Description Promise object Returns an estimate of the amount of gas that would be required to submit the transaction to the network. This is an estimate of the amount of gas required to submit the given transaction to the network. An example of the output is

{ "type": "BigNumber", "hex": "0x6d22" } .

# **Example Request and Response**

Prerequisite: You will need to install the Alchemy SDK before making requests with it.

The commands for installing it usingnpm oryarn are given below:

npm yarn npm install alchemy-sdk@latest yarn add alchemy-sdk@latest

### Request

Here is an example of how to make an estimateGas request using the Alchemy SDK:

estimateGas.js // Imports the Alchemy SDK const {Alchemy ,Network ,Utils }= require ("alchemy-sdk" );// Configures the Alchemy SDK const config = {apiKey :"demo" ,// Replace with your API key network :Network .ETH\_MAINNET ,// Replace with your network };// Creates an Alchemy object instance with the config to use for making requests const alchemy = new Alchemy (config );const main = async ()=> {const response = await alchemy .core .estimateGas ({// Wrapped ETH address to :"0xC02aaA39b223FE8D0A0e5C4F27eAD9083C756Cc2" ,// function deposit() payable data :"0xd0e30db0" ,// 1 ether value :Utils .parseEther ("1.0" ) });//Logging the response to the console console .log (response ) }main ();

### Response

JSON {"type": "BigNumber", "hex": "0x6d22" }

### **Code Sandbox**

You can test out the estimateGas method using the code sandbox below:

# **Use Cases**

Here are some common use cases for the estimateGas method:

- · Optimizing transaction fees
- : Gas is the fee paid by the sender of a transaction to compensate the miners for processing it. By estimating the gas required for a transaction beforehand, developers can optimize their transaction fees by choosing the right gas price and limit
- Ensuring successful transactions
- : If a transaction runs out of gas before it is completed, it will fail and the sender will lose the gas spent on it. By estimating the required gas beforehand, developers can ensure that the transaction has enough gas to complete successfully.
- Validating transaction parameters
- : When submitting a transaction, certain parameters such as the gas limit and gas price must be set correctly to avoid issues such as network congestion or excessive fees. By using
- estimateGas
- , developers can validate these parameters before submitting the transaction.

# **Related Methods**

Here are the methods related to estimateGas :

- getBalance: Returns the balance of a given address as of the provided block.
