Asset Changes

Simulates a transaction and returns a list of asset changes.

Try it out -alchemy simulateAssetChanges .

How does it work?

- 1. You give us a transaction (unsigned transaction object)
- 2. We simulate your transaction on our blazing fast infra 5
- 3. We return a complete list of asset changes (including tokens and NFTs)

What do you get back?

We currently return the following info:

- gas used
- change type (approval, transfer)
- asset type (native, erc20, erc721, erc1155, special nft)
- sender / destination
- amount
- additional metadata (logo, token id, contract address)

Examples

Chain support

The examples below are for Eth Mainnet and Polygon Mainnet. Simulation also works on Arbitrum and testnets - more examples coming soon!
