The rocket raising dApp, Fomo3D, has accumulated more than 17000 ether at present, mostly in last two days. I read the contract code and wondering where the game heading and end up. One possible outcome (tell me if you find another one) is the game will attract a huge amount Ethers, and can do it again and again. Not to mention lots of me-too follower. Ultimately, it will drain all liquidity of Ether and let the winner takes all. Then Ethererum's network value will be largely destroyed. And the question is: If a blockchain could be destroyed by an app running on it (Fomo3D is absolutely valid, no hacking), is that a systemic defect of mechanism design?

I hope I'm wrong, please correct me if you can.
