Hello Lido Team,

From about 2023-02-16 17:58 UTC to 2023-02-16 21:36 UTC, epoch 181631~181665, the 268 Ethereum validators run by HashQuark failed to make attestations due to the unexpected downtime of AWS server.

We suggest compensation of 0.2108 ETH, similar to this incident, we have tested our phone call system on Prater test network, and will deploy it on the Ethereum Mainnet soon. To prevent validator disruptions caused by server restarts, we will complete the server migration within two weeks. Additionally, we're currently testing the Geth client on the Goerli test network using Pebble DB and plan to upgrade it in the future when performing well. We are happy to get guidance on this incident suggested by gov ops.
