hello. i'm participating on an online hackhathon called ethglobal, and my mission inside it is to build an app powered by apecoin. it will be a 24/7 radio, on which only the holders of the anky genesis nft collection will be able to push music into it.

any person can listen.

the mechanics of the radio are on the readme file on this repo:

github.com

ankylat/anky_radio/blob/main/README.md

anky_radio

POWERED BY APECOIN

- only holders of the anky genesis nft can add music to the database.
- every time a piece is added, it goes to the system with a state: future.
- the radio is an eternal thread of music, sending it from the future to the present.
- one at a time.
- if there are no more pieces in the future, all of the ones that are on the past are sent to the future.
- and it starts again.
- over and over again.
- fully onchain.
- full groove.

if you want to contribute, it is all open source.

if you have any questions, please ask them here. i need your help in order to understand how to build this thing.

i need to understand which will be the connection between apecoin and music.

this is my exploration into that.
