Strategy Borrows

Description

This dataset provides the borrows made to the Yearn v2 Vaults by the associated strategies. Only the pools in Ethereum L1 are taken into account and thevaults feature can be used as an unique identifier for the individual vaults, while thestrategy_address feature can be used as an unique identifier for the strategies. The dataset contains all the deposit data from vault's inception. Thevalue feature contains the token amount that has been correctly divided by thedecimal power of 10, to avoid overflows.

Schema

- evt_block_time - datetime of the deposit execution
- evt_block_number - block number of the deposit execution
- vaults - contract address of the Yearn Vault
- strategy_address - contract address of the strategy
- token_contract_address - contract address of the underlying token
- token_symbol - symbol of the underlying token
- token_decimals - decimals of the underlying token
- value - deposit value in tokens (value is already decimalized using token_decimals)
-

Potential Use Cases

- vault APR optimization
-

Use example

```

Copy fromgiza_datasetsimportDatasetsLoader

# Usage example:

loader=DatasetsLoader() df=loader.load('yearn-strategy-borrows')

```

[Previous Individual Vault Withdraws](#) [Next Strategy Returns](#)
