Would people be interested in someone (i.e. me) building a python wrapper over the RPC calls necessary to interact with the scrt network to enable more script-based access to it?

Also, for team members, where would I get a good rundown on the docs for the enigma client interface?

I've already asked abt this on cosmos, https://forum.cosmos.network/t/python-interface-for-querying-rest-api-on-subchains/3340
