Hi Flashboters, I'm a researcher and nomad looking to learn more about Ethereum by running a validator on testnet. This week I'm starting research on remote self staking (RSS) [1] as I wrap up my current project on the [Safe](#) grants council helping teams finish wave 1 of the grants program.

- If [builder](#) is used for ETH staking relayers then I see there's a method to upload blocked addresses: --builder.blacklist

- Then a self staker can create and upload a block list based on [OFAC's list](#).

- And/or cross reference and upload the ["Ethereum addresses added to the OFAC SDN list"](#) created by Ethereum contributors with the OFAC list above.

Much appreciated!

*None of the info I share or receive is financial or legal advice.

[1]: Remote self staking (RSS) = Running an ETH staking validator in a separate location than where you live/spend most of your time, e.g. nomads.
