Assuming we have a leveraged trading position on Aave using aTokens as collateral and vTokens as debt. Are there examples of how this position could be easily split into two or more accounts (any given ratio 0-100%). To split e.g. the following actions could be considwered

- Both collateral and debt are transferred to a third party in the same ratio (in-kind transfer)

- Debt is repaid, and released collateral is transferred to a thirty party in the same ratio
