ACI wants to update the community regarding the current correlated-price assets that have been in progress. These assets have been eagerly anticipated by the community, and they are now moving forward.

As previously discussed, correlated-price assets like ETH liquid staking tokens have been incorporated under the Correlated-Asset Price Oracle (CAPO) that has been developed by BGD and recently passed AIP voting.

Assets that have already passed ARFC voting stage are currently in expedited onboarding process now that CAPO is complete.

Liquid staking and restaking tokens:

- sfrxETH

- osETH

- ETHx

- weETH

Interest bearing stablecoins:

- sFRAX

- stEUR

Additional assets are in TEMP CHECK or ARFC comment process and will be expected to be implemented with oracles under CAPO:

- wbETH

- BNBx

- sUSDe

While the community is eager to onboard these assets, there is still some additional work to be done before final AIP and listing. CAPO is not the only dependency for correlated-price assets. Each LST/LRT and stablecoin needs to be evaluated ad-hoc, security wise, in order to make a reasonable 1:1 assumption that can then be implemented in development.

We request the community be patient while this evaluation and work is done, and rest assured that each asset is working it's way through the necessary process for timely onboarding.
