crosschain privacy preserving contract calling biweekly update!

Technical:

Have added a couple more signatures to prevent user-forging attacks. At this point we're defending against everything but 'total network failure to forward messages', if at least one honest message ever gets through the protocol works. Basically signing every mutable packet at this point lol. Calling it good here for security reasons, since nobody's beating byzantine generals.

Nontechnical: meeting with slabs to discuss grant tomorrow, meeting with more vcs this week, dropping into committee meetings. Also have spoken to a couple devs for potential hires post funding.
