I would be interested to see what the sentiment is for supporting Ethereum clients with something like 1% of revenue.

TLDR: Ethereum clients are essential to operations

Many of you will know the benefits of co-funding clients and developing new clients.

- Sustaining the Infrastructure Long term

- Clients could accelerate their development, stability and security.

- New clients could start knowing there is a potential path to financial stability which would drive innovation in the space.

This alignment of working together sends a powerful message that the whole network is working even closer together to bring Ethereum further, plus reducing the risk of attacks or network disruptions.

Allocating 0.5% or 1% of revenue to support Ethereum clients promotes ecosystem sustainability, aligns the interests of protocols and clients, encourages competition and innovation, improves user perception, and ensures long-term protocol stability.

Protocol Guild is just one angle; to ensure that it is not a centralising factor, this could be done independently.

Over time this could even be expanded to include many other essential tools (monitoring, explorers etc.)
