Staking of dApp Token

Each of the AVSes leverage restaking to bootstrap the AVS. Moreover, each AVS will also support dual staking whereby, an AVS operator will be required to bring a certain dApp token alongside LST tokens like stETH. This will help bring more utility for the dApp token via rollup services and will also allow dApp team to incentivize operators who help create secure the AVSes by staking the dApp token.

Moreover, if any of the AVS operators deviates from the protocol, then the stake can be slashed.[Restaked Rollups - Previous SQUAD for Decentralised Sequencing](#) [Next- Rollup-as-a-Service What is Rollup-as-a-Service (RaaS)?](#) Last modified2mo ago
