seid tx ibc-transfer transfer

Transfer a fungible token through IBC. Timeouts can be specified as absolute or relative using the "absolute-timeouts" flag. Timeout height can be set by passing in the height string in the form {revision}-{height} using the "packet-timeout-height" flag. Relative timeout height is added to the block height queried from the latest consensus state corresponding to the counterparty channel. Relative timeout timestamp is added to the greater value of the local clock time and the block timestamp queried from the latest consensus state corresponding to the counterparty channel. Any timeout set to 0 is disabled.

Usage: seid tx ibc-transfer transfer [src-port] [src-channel] [receiver] [amount] [flags]

Examples: tx ibc-transfer transfer [src-port] [src-channel] [receiver] [amount]

Flags: --absolute-timeouts Timeout flags are used as absolute timeouts. -a, --account-number uint The account number of the signing account (offline mode only) -b, --broadcast-mode string Transaction broadcasting mode (sync|async|block) (default "sync") --dry-run ignore the --gas flag and perform a simulation of a transaction, but don't broadcast it (when enabled, the local Keybase is not accessible) --fee-account string Fee account pays fees for the transaction instead of deducting from the signer --fees string Fees to pay along with transaction; eg: 10uatom --from string Name or address of private key with which to sign --gas string gas limit to set per-transaction; set to "auto" to calculate sufficient gas automatically (default 200000) --gas-adjustment float adjustment factor to be multiplied against the estimate returned by the tx simulation; if the gas limit is set manually this flag is ignored (default 1) --gas-prices string Gas prices in decimal format to determine the transaction fee (e.g. 0.1uatom) --generate-only Build an unsigned transaction and write it to STDOUT (when enabled, the local Keybase only accessed when providing a key name) -h, --help help for transfer --keyring-backend string Select keyring's backend (os|file|kwallet|pass|test|memory) (default "os") --keyring-dir string The client Keyring directory; if omitted, the default 'home' directory will be used --ledger Use a connected Ledger device --memo string Memo to be sent along with the packet. --node string : to tendermint rpc interface for this chain (default "tcp://localhost:26657") --note string Note to add a description to the transaction (previously --memo) --offline Offline mode (does not allow any online functionality -o, --output string Output format (text|json) (default "json") --packet-timeout-height string Packet timeout block height. The timeout is disabled when set to 0-0. (default "0-1000") --packet-timeout-timestamp uint Packet timeout timestamp in nanoseconds from now. Default is 10 minutes. The timeout is disabled when set to 0. (default 600000000000) -s, --sequence uint The sequence number of the signing account (offline mode only) --sign-mode string Choose sign mode (direct|amino-json), this is an advanced feature --timeout-height uint Set a block timeout height to prevent the tx from being committed past a certain height -y, --yes Skip tx broadcasting prompt confirmation

Global Flags: --chain-id string The network chain ID --home string directory for config and data (default "~/.sei") --log_format string The logging format (json|plain) --log_level string The logging level (trace|debug|info|warn|error|fatal|panic) --trace print out full stack trace on errors Last updated onJuly 1, 2024 ibc-transfer ibc
