The Last Legacy Streams and the Launch Project

Removing all Legacy Streams

In our journey towards Endgame, we've been working over the past few months to phase out all legacy compensation streams (MIP40s). This effort has involved transferring the streams to the Atlas whenever feasible. In cases where immediate integration into Atlas wasn't possible, these streams have been temporarily managed by the Launch Project. This step is part of the larger, ongoing strategy announced several months ago to streamline our operations, which is a core objective of Endgame and will set the project up for longer-term success.

The Transition

As a reminder, the Launch Project takes on a pivotal role during this transition phase. It oversees and manages the relevant budget streams, ensuring a smooth transition from the legacy systems. This move aims to maintain operational continuity while we lay the groundwork for the Atlas system. The Launch Project bridges our current operations and the future state, ensuring no disruption in the DAO's operations and processes.

Moving Forward

The work related to removing legacy streams is not new. As the work around improving the Atlas's ability to direct operations formalizes, this is a needed step to continue the Atlas's development.

This stage is critical for aligning our operations with our long-term strategic goals. In the coming months, we will see an intensification of these efforts as we move closer to fully implementing the Atlas system, both for the rules and funding of operations.
