seid tendermint inspect

inspect runs a subset of Tendermint's RPC endpoints that are useful for debugging issues with Tendermint.

When the Tendermint consensus engine detects inconsistent state, it will crash the tendermint process. Tendermint will not start up while in this inconsistent state. The inspect command can be used to query the block and state store using Tendermint RPC calls to debug issues of inconsistent state.

Usage: seid tendermint inspect [flags]

Flags: --db-backend string database backend: goleveldb | cleveldb | boltdb | rocksdb | badgerdb (default "goleveldb") --db-dir string database directory (default "data") -h, --help help for inspect --rpc.laddr string RPC listenener address. Port required (default "tcp://127.0.0.1:26657")
