As mentioned in [a recent post](), one challenge for Lido to decentralize the process of onboarding new validators is measuring validator performance over time and across different node operators.

Luckily, this is something that can be done today, for Lido's current set of node operators. Having these measurements would make explicit where, in practice, the "bar" is set today, and can be used as a benchmark for a future, more open, node operator selection process.

[LEGO]() would therefore like to request proposals to build an easily accessible dashboard where the Lido community can measure the performance of validators.

The dashboard should have information on all current Lido node operators, and track the following metrics:

- Attestation Percentage;

- Block Proposal Percentage;

- Balance;

- Income earned (average daily/last week/last month/since live);

- Other relevant metrics at your discretion.

The dashboard should also keep historical records for all of these metrics, and ideally allow viewers to export the raw data for the pupose of further analysis.

If you would like to apply for this bounty, please share your proposal here. You can reach out to [@timbeiko]() or [@vshvsh]() for questions.
