Orca: find out more

From humble beginnings: just two builders hacking at a desk in Tokyo, with no venture funding, famous backers, nor experience running a start-up: Orca has grown to become a household name in the Solana ecosystem, and beyond.

Today Orca is a DAO, with powers delegated to a [DAO council](), established through an ORCA holder vote. Holders of the ORCA token can engage with governance, by formulating, discussing and refining proposals (see [Orca for Holders]()), and help plot Orca DAO's course through the DeFi seas.

On Orca, you can trade tokens cheaply, quickly, confidently (thanks to the [Fair Price Indicator]()), and with low slippage (thanks to the capital efficiency of Orca's CLAMM pools). As a liquidity provider, you can also create pools (see [Community Listing]()): a simple UI enabling anyone to create a pool for the vast majority of SPL tokens, with adjustable fee tiers.

As an asset lister you can create truly permissionless pools for your token launch, using any SPL token on Solana (see [Orca for Asset Listers]()).

As a builder you can tap into the most efficient source of liquidity on Solana, build quickly and easily using Orca's double audited, open-source [smart contract]() and open-source [SDK](), and join the growing number of projects that are integrating with Orca.

You can read more about Orca's voyage through 2022, in [Ori's look back at 2022]().
