Why are not all collaterals from the Mainnet supported on Polygon? I'd love to stake my Chainlink, SNX and CRV on Polygon. CRV is especially weird that it's not included in the collateral list, because CRV is also on the Polygon network.

Do we really have to go through the entire process of adding every single collateral through the Proposals and Voting for every single collateral again? Or is it actually possible to add all approved collaterals on the mainnet with a single request?
