Data Indexers

Data indexers organize and index blockchain data, enhancing the efficiency of data retrieval and querying for applications and users.

The Graph

[The Graph](#) The Graph is a decentralized protocol for indexing and querying data from blockchains, simplifying access to data that is otherwise difficult to query directly.

The Graph is live with:

[Subgraph](#) : Extracts data from a blockchain, processing it and storing it so that it can be easily queried via GraphQL.

Goldsky

[Goldsky](#) is the go-to data indexer for web3 builders, offering high-performance subgraph hosting and real-time data replication pipelines.

Goldsky is live with:

[Subgraph](#) : Customized endpoint that allows applications or backends to directly access live, real-time data, eliminating the need for maintenance.

[Mirror](#) : Goldsky's Mirror feature provides a tool for directly streaming live data into databases or data warehouses, enabling easy and efficient data integration. [Previous Gelato Services](#) [Next Block Explorers](#) Last updated10 months ago
