As you know the gas costs have become a sort of a burden for a lost of the users, especially those who deal with lower amounts. While we are awaiting the proliferation of one or multiple L2 solutions, I am questioning the possibility of subsidizing the gas costs for Aave users until the L2 approach is feasible and provides a good user experience.

In this sense it is interesting to discuss and potentially implement a mechanism through which the protocol can sustain these costs in a sustainable way. My initial take concerns the use of protocol fees to cover the gas costs, however it is not clear to me what are the monthly gas expenses for Aave users and how do they compare to the fees generated from protocol usage. We need to see the stats regarding the aforementioned figures in order to gauge the fesability of this proposal.
