I would like to hear from searchers related to the following

Visualization for builders reputation

thanks to Thogard, Dougie DeLuca, ek, askyv, masato james, jun, yupi for discussion and feedback. Abstracts This article addresses the centralization of block builders, which may reduce the user experience and censorship resistance of Ethereum....

I would like to create a local module that will curb builder fraud and allow searchers to send bundles to multiple builders.

If we can create a local module like the one in the image below that can replace AB testing for searchers, we can distribute the order flow to reputable builders. Searchers can minimize the opportunity for theft and trust.

As a step toward implementing this, we would ask the following questions

- How to identify MEV stealing

- I would like to know if you have experience with MEV stealing or if there is a pattern to it

If this can be discussed and clarified, Ethereum will be much closer to a better system.
