I have heard from two different people working on Flashbots (https://docs.flashbots.net/) that they have been able to run EVM inside SGX for over a year now

.

For those of you who do not know Flashbots, they work on the Miner (Maximum) Extractable Value problem. Miner Extractable Value means that validators / miners who create blocks can sequence transactions at their benefits (front-run TXs etc.).

Running an EVM inside an SGX sounds like it would be a huge improvement for Secret Network, as it would potentially allow Ethereum / EVM applications to be deployed to Secret Network. This can be a huge growth lever for the network.

@assafmo @Cashmaney this may be something interesting to validate / look into
