Bond Tokens

On the Secret Network mainnet, we delegateuscrt , where1scrt = 1000000uscrt . Here's how you can bond tokens to a validator (i.e. delegate):

```
```

Copy secretclitxstakingdelegate\\ --from=

```
```

Example:

```
```

Copy secretclitxstakingdelegate\ secretvaloper1l2rsakp388kuv9k8qzq6lrm9taddae7fpx59wm\ 1000uscrt\ --from

```
```

is the operator address of the validator to which you intend to delegate. If you are running a full node, you can find this with:

```
```

Copy secretclikeysshow--bechval

```
```

Where is the name of the key you specified when you initializedsecretd .

While tokens are bonded, they are pooled with all the other bonded tokens in the network. Validators and delegators obtain a percentage of shares that equal their stake in this pool.\
