I am reading that SCRT coin transactions are not private, but all tokens are private.

What part of token transactions are private on the Secret Network? If wallet A sends quantity N of token T to wallet B, does the public record reflect A, N, T, or B?

Looking at the block explorer, I see many "wallet A interacted with contract T" so I think wallet A and token T are publicized, while the recipient wallet B or the quantity N are not revealed.
