Following the [request for proposal for CSM and SDVTM](#) integration, the [attached document](#) outlines Stereum's proposal to integrate the CSM & SDVTM Lido Community Staking Modules into its Ethereum node setup tool. This integration aims to simplify the setup and management of Ethereum nodes, enhancing accessibility to LIDO's services and aims in a first step for TIER 0 & TIER 1 of the outlined qualifications, later building on this to provide a service up to TIER 4.

Key highlights include:

- User-Friendly Enhancements: Introduction of one-click installation options for both Lido Community (Vanilla) Staking and Lido Community DVT Staking Modules, streamlining node setup.

- Custom Installation Options: Flexibility for users to incorporate Lido staking services into various infrastructure setups, with custom installation choices.

- Monitoring and Management: Enhanced UI features for node monitoring, including new dashboard components, validator list updates, and in-app alerts tailored for Lido staking.

- Maintenance and Support: Commitment by Stereum to provide ongoing support and updates, ensuring compatibility with future releases and offering user guidance.

- Budget and Phasing: The proposal requests a EUR 52 500 grant from the Lido DAO, with a phased approach encompassing research, specification, implementation, and testing.

This initiative marks a significant advancement in decentralizing Lido's staking services and enhancing their accessibility, furthering the realization of this vision. We are excited to be part of this important step, building together towards it.
