Classic: how to change yield display settings

Orca's pool explorer displays yield estimates using the formula24h Yield / TVL rather than generating an APR estimate.

However, Orca allows users to change how the UI displays estimated yield by multiplying24h Yield / TVL by a chosen number of days. When using this setting be mindful that past activity is not a guarantee of future returns.

To change the yield display settings:

1. Navigate to theLiquidity
2. page.
3. With theExplore
4. tab open, click theSettings
5. button.
6. ?
7. UnderProject 24h yield over...
8. select the drop down arrow.
9. ?
10. Select a timeframe of your choosing.
11.

The UI will adjust the displayed yield estimate to match the chosen timeframe. The displayed figure is a simple multiplication of24h Yield / TVL by the selected number of days and should not be relied on as an expected APR.
