With isolated margins and AMM implemented, we must emphasize faster listings to stay competitive among numerous CEX and DEX platforms. For highly anticipated projects like LayerZero and ZKSync, we should list them immediately, ideally within hours of their spot trading going live. Initial days generate the highest volumes, and platforms like Aevo achieve volumes $4-5 million in these periods by listing quickly. Therefore, we need an expedited route for listing votes, bypassing the usual 4-day on-chain process.
