I know you said in the docs (https://enigma.co/protocol/GettingStarted.html) that Macs won't work (as mentioned in https://github.com/ayeks/SGX-hardware, they have SGX support but there's no way to turn it on in bios).

But I tried to run the docker image anyway, and execute the CoinMixer example, and… it did not explode

Does it mean it worked? I have no idea
