CSV Exports

Export of blockchain entities related to address into a CSV file

Export to CSV gives users a way to easily download and analyze blockchain data. It is available for tabs on the address page including transactions, internal transactions, tokens, and logs.

Note: simplified CSV exports (transactions and transfers only, with no ability to define time periods) exist in Blockscout releases up to 3.5.1. Enhanced CSV export is available from v3.5.2+ ?

You will find theDownload CSV button under the list of entities related to the tab.

?

Note: under theTokens tab, the list of token transfers will be exported. After clicking the button you will be forwarded to a/csv-export page for a given address and given type of export (transactions, internal-transactions, token-transfers, logs).

?

It is possible to specify an arbitrary period for the data export. By default, the current period is the previous month. After completing the reCaptcha, the data for the chosen period should be exported.

?

Tip : In order to prevent hitting a 30 secs loading timeout, choose the smallest time period possible for your data needs.
