Unshielding Assets

You can unshield assets in the MASP by making a transfer from a shielded address to a transparent address. This is known as anunshielding transfer .

Assets can also be sent directly from a shielded address through IBC -- see the section on Shielded IBC for details.

Making an unshielding transfer

Before making an unshielding transfer, it is recommended to first sync the local shielded context:

namadac

shielded-sync

--spending-keys

< your-spend-ke y

> To make an unshielding transfer, you must possess the relevant spending key. See the glossary for an explanation on the types of keys and addresses used with the MASP.

namadac

transfer \ --source

< your-spend-ke y

\ --target

< destination-transparent-addres s

\ --token

< token-addres s

\ --amount

< amount-to-unshiel d

\ --gas-payer

< your-implicit-accoun t

> ð¡ Note: you must provide an implicit account you control containing funds for transcation fees. This does not have to be the same as the target.
