Description

Biconomy Smart Accounts are flexible in allowing you to use any signer from an EIP-1193 provider, (or simply an ethers signer) to create a Smart Account. Let's take a look again at how we initialize a smart account:

```
const biconomyAccount =

await

createSmartAccountClient ( { signer :

{ } ,

// viem wallet or ethers signer object bundlerUrl :

"" ,

// <-- Read about this at https://docs.biconomy.io/dashboard#bundler-url biconomyPaymasterApiKey :

"" ,

// <-- Read about at https://docs.biconomy.io/dashboard/paymaster } ) ;
```

The ownership module for the smart account takes the ethers signer object to link the Smart Account to an EOA that will sign on its behalf. [Previous Signers](#) [Next Sign with EOA](#)
