Hey all,

We've recently had some developers working on and making progress with machine learning on Enigma. While there are constraints, we are moving forward. We'll kick off 2020 with a working group on private machine learning. The focus will be narrow, at least to start:

1. what are the differences between Enigma's Rust library and the standard rust library? How does this impact ML work?

2. creating examples of successful use of rusty-machine within Enigma

3. Discussion of how ML functions can be extended to business applications (i.e., conversion analysis, impact assessment, and so forth).

We expect this group to meet or synch up possibly on a monthly basis, but all work will take place publicly. We have not yet confirmed how, but I expect we can have high-level conversations here on the forum and create a shared repo for technical work and issues.

Looking forward to next steps on this. Comment below if you want to be involved and kept abreast of this or if you have anything to share in this direction that can help us kick off.
