Hi,

I'm trying to understand how LTV is used in the aave v3 smart contract. I read through the code, but don't see anywhere LTV is used when validate borrow transaction. I only see HF needs to be greater than 1.

I'm wondering whether LTV is only used in the frontend to enforce max borrow amount?

I tried to interact with the contract directly, and I'm actually able to borrow more money than my supplyLTV amount.

Does that mean one can borrow out more money than AAVE claimed (Supply

LTV) as long as it's not making HF<1?

Is LTV enforced on the smart contract level?
