Greetings community,

This thread is dedicated to tackling Secret IBC relayers problem. With the way IBC works, we need unique relayers on both the sending and receiving network of any given blockchain communication. Here is the following feedback we are looking for:

(1) Which networks would we like to prioritize connecting to?

(2) Is there anything special required for relayers from the Secret Network side of hardware or set-up?

(3) Who is interested in being a relayer?

(4) What should the incentives be for relaying?

If you are interested in participating in Secret Network relaying, please comment below as we are forming a list of interested individuals.

Thanks,

Carter Woetzel
