You will notice that your "corr w/ metamodel" for each round never changes – the metamodel is the ensemble made of all staked models, and weighted by those stakes. So once each round is started and stakes are in, that's the metamodel for that round, it doesn't change. What does change every day is the real stock market, and the therefore the ground truth of the targets we are predicting, i.e. the "answers" to the question we are asked change everyday, but only the final day of each round actually counts for our score that round – all the other days were just for fun looking at. So think of it like you are predicting the spread of an in-progress basketball game – each update tells you what your final score would be IF

the game ended right now. But only the actual real end of the game and your final result actually count.
