Vision

Decentralized exchanges are one of the most critical Lego blocks of DeFi and the primary source of real yield. At Velocore,we aim to become the top DEX for major new chains and the standard for efficient DEXs.

Our belief is that a leading DEX should fulfill the following criteria:

1. Make it possible totrade major tokens with minimal slippage
2. . This, in turn, would increase thesize
3. of the liquidity pool itself while at the same time increasing the exchangeefficiency
4. of the liquidity that exists.
5. Host and attract awide variety of tokens
6. so that all transactions can be done within a single platform as much as possible. Velocore aims to become the home of a broad array of tokens.
7. Essential optimization of gas costs
8. for the users. Given that over 95% of transactions are of smaller sizes, the real exchange rate is significantly impacted by gas costs, particularly on chains based on Ethereum.
9. The incentive system should beeasy to understand and predictable
10. . Minimizing user confusion and eliminating inconvenience will help find the optimal sweet spot and accelerate the momentum of the flywheel.
11.

In order to achieve this, Velocore ensures a clear and predictable voting and reward system. However, it's carefully designed to not be so recurrent per epoch or per NFT as to consume unnecessary gas and time.

The AMM itself has also dramatically reduced gas usage while creating an environment where swaps can be made with very low slippage using a variety of pools, including Stableswap, NFT sudo-swap, up to 8 tokens pool, and nested interest-bearing pools.

Velocore prides itself on being the most efficient DEX currently available, and we have strived to establish the benchmark for exceptional decentralized exchanges in the coming future.
