Stargate Composability

The simplest form of composing Stargate

StargateComposer.sol

StargateComposer is a wrapper contract used to add additional functionality to Stargate Composed calls. Now contracts that want to compose Stargate will need to callswap via the[StargateComposer](#) contract instead of the[Stargate Router](#) . The new StargateComposer adds themsg.sender into the payload so the destinationsgReceive can now identify the source address that initiated the swap via the_srcAddress .

Composing Stargate will revert on source if not using the StargateComposer. StargateComposed deployed as a wrapper on both source and destination chains
