Automating Restarts

By defaultBlockScout does not restart if it crashes. To enable automated restarts, set theenvironment variable HEART_COMMAND to whatever command you run to startBlockScout . Configure the heart beat timeout to change how long it waits before considering the application unresponsive.

At that point, it will kill the current blockscout instance and execute theHEART_COMMAND . By default a crash dump is not written unless you setERL_CRASH_DUMP_SECONDS to a positive or negative integer. See theheart documentation for more information.
