What is the disadvantage to using RAFT leader election for the validator committee in Casper whereby validators are moved in and out of the committee one at a time versus swapping out the entire committee at regular intervals?

This would allow us to leverage a tried and tested approach to leader election and would allow for a constantly fluctuating pool of the validator committee members vs. locking up the collective in for a predetermined number of rounds. We could perform the same sort of operation on the current committee for deciding which member(s) will be being replaced by the new committee member(s).
