Hi y'all! Wanted to give an update on TNLS (crosschain privacy-preserving contract calling – to secretswap/secret bridges what layer zero/axelar are to normal bridges) progress!

Milestones:

technical: I've written up a full spec of all the contracts required for the system and started proving security (nothing too complicated, shouldn't be that many months work for a single-node based MVP though obviously building a new network for true decentralization will be a bit harder)

Nontechnical: reaching out to a bunch of angel investors/grant sources. Also am starting to craft my community pool ask.

Feel free to ask questions here!
