Simple Summary

This is to gauge the community's interest in launching an ETH Correlated E-Mode on Optimism. We welcome feedback from all contributors and community members.

Risk Parameters

Below is an illustrative example of what an initial launch's conservative supply cap, aggressive supply cap, LT, LTV and LB

parameters may look like. Depending on the length of this community discussion, changing market conditions may warrant different parameters. These parameters are following [Gauntlet's LST E-Mode Methodology](#), and were posted originally in the [table](#) of that forum post.

For transparency, as inputs to our recommendations, the below table also shows our abnormal and normal calculations as stated in the [methodology](#).

chain	asset	abnormal	normal	conservative	aggressive	LT	LTV	LB
optimism	WSTETH	2800	1600	4020	8900	91	88	2
