[TEMP CHECK] Arthera Blockchain integration

Author: Fabs, Arthera's promoter

Date: 2023-09-25

Summary:

Arthera is a new EVM compatible L1 that will be enhanced by a DAG-based PoS model and will go mainnet end of year. We would like to onboard AAVE on testnet at first and on mainnet as soon as it is launched.

Motivation:

Arthera aims to highlight the importance of dApps and offers several advantages to projects integrating the Network:

- Grant program

- Direct access to Arthera core team

- Co-marketing

- Revenue sharing model: earn a share of the network revenue (see gasfee rebase model and subscription model- link to docs in specification section).

Specification:

- Deploy AAVE contracts on Arthera testnet and then, later, on mainnet.

- Official announcement of AAVE expanding to Arthera

All important technical info on:

[Arthera Developers | Arthera Developer Documentation](#)

We will provide detailed technical information when/if we reach the ARFC stage.

Next steps:

If this TEMP CHECK reaches a positive outcome Arthera's core team will submit a formal proposal (ARFC) containing the grant amount and details, more technical details about Arthera and its integration.

If the snapshot outcome is YAE, Arthera will announce officially AAVE's onboarding and provide technical assistance if needed.

AAVE will be deployed on testnet and, later, on mainnet.
