Today, I want to start unveiling a new and exciting chapter for Secret

.

While we can't reveal all the details just yet—keeping our competitive edge is crucial—we can promise you that Secret Network, the pioneers of DECC blockchain based on TEEs, is setting its sights on something even more transformative.

Now we want to build something bigger, something that will find use both in the Web3 and Web2 worlds - an end-to-end confidential computing platform for some of the most exciting applications.

With Secret Network as the base layer, we are adding TEE-enabled GPUs as off chain workers, creating the first end-to-end confidential computing platform where both user data and metadata are protected. This platform will be permissionless, decentralized and confidential, offering something completely new in the market. This isn't just about infrastructure; it's about creating real-world value.

To achieve this vision, we must adapt. We are streamlining our operations, refocusing resources, and doubling down on our core strengths: thought leadership, DeCC, and business development. This lean approach will position us perfectly for the next big leap forward

To sustain our efforts over the next six months, we will propose a 12% tax to support SNF

. During this period, we will be finalizing the new strategy, revealing some of the core technology and consolidating a strong roadmap.

Importantly, we won't increase our burn or ask for additional operational funds during this period. As the token price rises, any extra funds will be directed towards building a strong treasury for SNF.

Both Labs and SNF have been deeply engaged in refining our tokenomics models, and while this work is on hold for now, it remains a crucial part of our future plans.

We are incredibly excited about what lies ahead and look forward to embarking on this journey together with your support.
