Looks like Uniswap has become Google in terms of how easy it is to get to an human, so I will allow myself to post an uncategorized topic.

Because the voting interface almost never works. Tried from 10 different countries and probably 4-5 devices. Some days - like today - it just won't work regardless of browser, adblocker, extensions, connection quality, use of VPN, etc…

The only thing in common I think is that a Linux kernel is on all of my devices.
