In the blog [The Road to Trustless Ethereum Staking](#) 140iq elite nerds talk about creating a permissionless frame-work for validators to onboard themselves to limit the governance needed, making Lido more permissionless.

I see future problems with how Lido decides which staking tokens to make. Lido is going to be creating many staking tokens in the future. stETH, bLUNA, BETH, stKSM, stDOT, stAAVE, stMATIC, etc.

Each proposal has had different terms, agreements, and vesting schedules. This could become problematic because how is Lido supposed to determine which staking token is more important than others? How will teams building these staking tokens feel when they are getting different deals than other teams?

We should at least get consensus over what terms Lido finds acceptable.

Thoughts?
