Hello, I'm reading the EigenLayer docs and I came across this defintion of delegation: " Delegation is the process where stakers delegate their restaked ETH or LSTs to Operators or run validation services themselves, effectively becoming an Operator. This process involves a double opt-in between both parties, ensuring mutual agreement. Restakers retain agency over their stake and choose which AVSs they opt-in to validate for."

The last sentence is confusing me because as far as I am aware, Operators decide which AVS's they validate for, delegators decide which operators they want to delegate to, and delegators can see which AVS's Operators validate.

I guess delegators can loosely decide which AVS's they want to validate by deciding which operator to delegate to. But after picking an operator, there is no granular choice for a delegator to decide which AVS's to validate, right?
