Hi everyone,

Current liquidity of $DYDX token on Osmosis is pretty low, just ~165k based on Defillama stats
https://defillama.com/protocol/dydx.

As a token holder, I do believe in be-able-to-exit at anytime right, but thin liquidity means less attractive to users to buy/sell $DYDX token.

How can we solve it? I think DYDX foundation should lead the discussion to increase $DYDX liquidity pool, something similar to MakerDAO team that supply MKR liquidity by using Uniswap pool, by that they created the confidence to token holders and got extra income from swapping fees.

Welcome all for your comment/feedback on it.
