I am pretty sure most people don't want to connect their public information and their financial situation, for as long as ethereum exisits. But web3 and new Dapps make it super easy to connect your social profile through peepeth and your erc20 and eth holdings. I wanted to start a discussion about how Dapps and Dapp browsers should change.

Using different addresses for different Dapps would be a great start. And creating methods to avoid connections from your existing accounts should be default. How can we make ethereum a little bit more private for the average user?
