From a user:

Would work Enigma without a blockchain? if i want something computed, then i can also ask someone "without" blockchain and pay for it with bitcoins. can also be automated. the auctioning in this respect would probably be implementable with normal p2p-messaging. "most of the often circulated use cases ("health care", supply chain, messenger, social media) can be implemented p2p and decentralized without blockchain. only in very special cases do you need a highly complex global consensus on the sequence of events among unknown, unfamiliar, potentially malicious actors. internet money makes this necessary, yes. everything else can also be a different kind of network, and is scalable.) Would MPC be not be safe without Blockchain ? Thanks
